## **Excell.Net Email Security Service**

### **Comprehensive protection for email and business**

Our Email Security Service is a fully managed cloud service that ensures the security, preservation and continuous operation of email communications. The service provides three critical functions to help businesses meet compliance requirements, protect privacy and ensure continuous on-demand access to email in the event of network or server outages.

### **Email Protection**

Our Email Security Service blocks unwanted mail, such as spam and viruses. It also protects against directory harvesting and denial of service (DoS) attacks, and makes phishing attacks apparent. What is unique about the service is our highly configurable, blended defense-in-depth approach. This technology has proven more effective in blocking threats, by one to two orders of magnitude, over traditional techniques. Comprehensive inbox controls and tools provide users with a unique method of judging each message's legitimacy and help to preserve the long-term integrity of users' primary email addresses and ensure the delivery of desirable mail.

### **Email Continuity**

Our Email Security Service protects your businesses against unplanned email outages by providing web access to all emails sent or received within the past 60 days. The service does this by automatically routing incoming, outgoing and internal emails through a class-A datacenter. Here all email messages and attachments are first filtered for spam and viruses and then indexed for search and retrieval, encrypted and archived 60 days at a time.

In the event your email server or network is down, users simply log-on to the email portal using an easy to use web interface. Now they are able to send new messages, reply to existing messages, search for specific messages or attachments, and recover deleted messages or attachments directly to their inbox. Email Continuity is always on, so users can access this solution 24x7x365.

### **Optional Email Encryption**

Our Email Security Service also provides customers the ability to encrypt outbound email messages. Email encryption is a policy based encryption solution that enables customers to achieve compliance with industry and government regulations with predefined, managed lexicons that automatically encrypt financial (FINRA/SOX/GLBA), personally identifiable information (PII), healthcare (HIPAA/PHI), and profanity based content. Customers can also mark emails as confidential within Outlook or use a force phrase to encrypt emails on demand.

## Our Email Security Service

- Highly configurable defense-in-depth method protects end users against spam, viruses, phishing attacks, denial-of-service attacks and other malicious email born threats
- Outbound spam and virus detection avoids RBL listing
- Unique Address-on-the-Fly® identifies address sharing and the sources of spam
- Email control panels simplify end-user self-service
- Schedulable quarantine summary
- Geographic and language based filtering
- Automatic spooling of all incoming email for 14 days in the event of a mail outage

## Email Continuity

- Automatically stores copies of inbound and outbound email in a secure repository
- 60 day storage and historical data upload
- Powerful search capabilities through simple user interface
- Recover one or many email messages to inbox
- Intuitive webmail client for continuous email access: send, reply and receive emails even in the event of email server or network failure

## Optional Email Encryption

- Automatic policy-based encryption: encrypt, reroute or block emails based on your policy
- Ad-hoc keyword encryption for greater control
- Tight integration with email security and archiving services
- Same capabilities used by the Federal Reserve Board and one in seven US hospitals
- International encryption policies available
- One-time registration at decryption portal
- Automatic policy based outbound encryption service
- Encrypt email on demand with the use of a force phrase or by marking an email as confidential within Microsoft Outlook
- Automated content scanning of messages and attachments
- Achieve compliance with industry and government regulations by utilizing predefined lexicons that support HIPAA, FINRA, SOX, GBLA and state privacy laws
